

Time Complexity Analysis

Initialization: Initializing '\$max' and '\$min' with the first element is a constant-time operation, $O(1)$

Iteration: The 'foreach' loop iterates through each element of the array exactly once. Each comparison operation inside the loop is a constant-time operation, $O(1)$. Therefore, the total time complexity of the iteration is $O(n)$, where n is the number of elements in the array.

Total Time Complexity: The overall time complexity of the function is $O(n)$ due to the single loop that processes each element once.

Space Complexity Analysis

Space Complexity: The function uses a fixed amount of additional space (for the variables '\$max' and '\$min'), regardless of the size of the input array. Therefore, the space complexity is $O(1)$.
